#### BACKGROUND OF THE INVENTION

The present invention relates to selective neuropeptide Y Y5 receptor antagonists useful in the treatment of eating disorders and diabetes, pharmaceutical compositions containing the compounds, and methods of treatment using the compounds.

Neuropeptide Y is a 36 amino acid peptide that is widely distributed in the central and peripheral nervous systems. This peptide mediates a number of physiological effects through its various receptor subtypes. Studies in animals have shown that neuropeptide Y is a powerful stimulus of food intake, and it has been demonstrated that activation of neuropeptide Y Y5 receptors results in hyperphagia and decreased thermogenesis. Therefore compounds that antagonize neuropeptide Y at the Y5 receptor subtype represent an approach to the treatment of eating disorders such as obesity and hyperphagia.

Phenyl amides and ureas are known as antiatherosclerotic agents, see for example U.S. 4,623,662, and benzoic acid amides are disclosed as antidiabetic agents in U.S. 5,378,728. N,N-alkylenebis-(benzamides) are known as endocrinological agents, see U.S. 4,009,208. WO 98/35957, published August 20, 1998, discloses amide derivatives as selective neuropeptide Y receptor antagonists.

#### **DETAILED DESCRIPTION**

Except where stated otherwise the following definitions apply throughout the present specification and claims. These definitions apply regardless of whether a term is used by itself or in combination with other terms. Hence the definition of "alkyl" applies to "alkyl" as well as the "alkyl" portions of "alkoxy", etc.

Alkyl represents a straight or branched saturated hydrocarbon chains having the designated number of carbon atoms. If the number of carbon atoms is not specified, e.g., if the term lower alkyl is used, chain lengths of 1 to 6 carbons are intended.

When X is  $-C(R^{25})=C(R^{25})$ -, both cis and trans configurations are comtemplated.

Cycloalkyl represents a saturated carbocyclic ring having 3 to 12 carbon atoms. Preferred are C<sub>3</sub>-C<sub>6</sub>cycloalkyl rings.

In the definition of  $R^{16}$ , the term  $(C_3-C_{12})$  spirocycloalkyl refers to a  $(C_2-C_{11})$  alkylene chain joined at both ends to the same ring carbon, i.e.,

10

15

20

25

30

In the definition of R<sup>6</sup> and R<sup>7</sup>, the term "heterocyclic ring" refers to 4- to 7-membered saturated rings comprising 1 to 3 heteroatoms independently selected from the group consisting of -O-, -S- and -NH-, with the remaining ring members being carbon. Where a heterocyclic ring comprises more than one heteroatom, no rings are formed where there are adjacent oxygen atoms, adjacent sulfur atoms, or three consecutive heteroatoms. Examples of heterocyclic rings are tetrahydrofuranyl, pyrrolidinyl, piperidinyl, morpholinyl, thiomorpholinyl and piperazinyl.

When two R<sup>12</sup> groups form a ring of the formula \ \ \frac{1}{p} \ , those skilled in the art will recognize that -NR<sup>8</sup>R<sup>9</sup> and -NR<sup>8</sup>C(O)R<sup>9</sup> substituents cannot be attached to a carbon adjacent to the piperizinyl nitrogen.

Halogen represents fluoro, chloro, bromo or iodo.

Polyhalo(C<sub>1</sub>-C<sub>6</sub>)alkyl refers to a straight or branched alkyl chain substituted by 1 to 5 halogen atoms, which can be attached to the same or different carbon atoms, e.g., -CH<sub>2</sub>F, -CHF<sub>2</sub>, -CF<sub>3</sub>, F<sub>3</sub>CCH<sub>2</sub>- and -CF<sub>2</sub>CF<sub>3</sub>.

Hydroxy( $C_1$ - $C_6$ )alkyl refers to an alkyl chain substituted on any substitutable carbon by a hydroxy group. Similarly,  $oxo(C_1$ - $C_6$ )alkyl refers to an alkyl chain substituted by an =O moiety.

Aryl represents phenyl or naphthyl.

Heteroaryl refers to 5- to 10-membered single or benzofused aromatic rings comprising 1 to 3 heteroatoms independently selected from the group consisting of -O-, -S- and -N=, provided that the rings do not include adjacent oxygen and/or sulfur atoms.. Examples of single-ring heteroaryl groups are pyridyl, isoxazolyl, oxadiazolyl, furanyl,

pyrrolyl, thienyl, imidazolyl, pyrazolyl, tetrazolyl, thiazolyl, thiadiazolyl, pyrazinyl, pyrimidinyl, pyridazinyl and triazolyl. Examples of benzofused heteroaryl groups are quinolinyl, isoquinolinyl, quinazolinyl, thianaphthenyl (i.e., benzothienyl), indolyl, benzimidazolyl, benzofuranyl and benzofurazanyl. N-oxides of nitrogen-containing heteroaryl groups are also included. All positional isomers are contemplated, e.g., 2-pyridyl, 3-pyridyl and 4-pyridyl. Preferred heteroaryl groups are pyridyl, isoxazolyl, thienyl, thiazolyl, pyrazinyl, pyrimidinyl, pyridazinyl, quinolinyl, isoquinolinyl and quinazolinyl.

When a variable appears more than once in the structural formula, for example R<sup>8</sup>, the identity of each variable appearing more than once may be independently selected from the definition for that variable.

For compounds of the invention having at least one asymmetrical carbon atom, all isomers, including diastereomers, enantiomers and rotational isomers are contemplated as being part of this invention. The invention includes d and I isomers in both pure form and in admixture, including racemic mixtures. Isomers can be prepared using conventional techniques, either by reacting optically pure or optically enriched starting materials or by separating isomers of a compound of formula I.

Compounds of formula I can exist in unsolvated as well as solvated forms, including hydrated forms. In general, the solvated forms, with pharmaceutically acceptable solvents such as water, ethanol and the like, are equivalent to the unsolvated forms for purposes of this invention.

A compound of formula I may form pharmaceutically acceptable salts with organic and inorganic acids. Examples of suitable acids for salt formation are hydrochloric, sulfuric, phosphoric, acetic, citric, malonic, salicylic, malic, fumaric, succinic, ascorbic, maleic, methanesulfonic and other mineral and carboxylic acids well known to those skilled in the art. The salts are prepared by contacting the free base forms with a sufficient amount of the desired acid to produce a salt in the conventional manner. The free base forms may be regenerated by treating the salt with a suitable dilute aqueous base solution such as

dilute aqueous sodium hydroxide, potassium carbonate, ammonia or sodium bicarbonate. The free base forms differ from their respective salt forms somewhat in certain physical properties, such as solubility in polar solvents, but the salts are otherwise equivalent to their respective free base forms for purposes of the invention.

Compounds of formula I may be produced by processes known to those skilled in the art as shown in the examples below. Typically, the claimed compounds wherein X is -S- or -O- can be prepared as shown in the following reaction scheme:

$$R^7$$
  $R^6$   $R^5$   $R^2$   $R^1$   $R^5$   $R^2$   $R^3$   $R^4$   $R^5$   $R^6$   $R^5$   $R^5$   $R^6$   $R^5$   $R^7$   $R^6$   $R^6$   $R^7$   $R^7$   $R^6$   $R^7$   $R^7$   $R^6$   $R^7$   $R^7$ 

wherein an amine of formula II is reacted with an acid chloride or carbamoyl chloride in the presence of a base, or with a carboxylic acid in the presence of standard amide coupling agents such as EDC and DMAP. Starting materials of formula II can be prepared using known methods.

The compounds of formula I exhibit selective neuropeptide Y5 antagonizing activity, which has been correlated with pharmacological activity for treating eating disorders such as obesity and hyperphagia.

The compounds of formula I display pharmacological activity in test procedures designated to indicate neuropeptide Y5 receptor antagonist activity. The compounds are non-toxic at pharmaceutically therapeutic doses. Following are descriptions of the test procedures. cAMP Assay

CHO cells expressing the various NPY receptor subtypes were maintained in Ham's F-12 media (Gibco-BRL) supplemented with 10% FCS (ICN), 1% penicillin-streptomycin, 1% non-essential amino acids and 200  $\mu$ g/ml Geneticin® (GibcoBRL #11811-031) under a humidified 5% CO<sub>2</sub> atmosphere. Similarly, HEK-293 cells expressing the various NPY receptor subtypes were maintained in Dulbecco's modified Eagle's media (Gibco-BRL) supplemented with 10% FCS (ICN), 1% penicillin-streptomycin and 200  $\mu$ g/ml Geneticin® (GibcoBRL #11811-031) under a humidified 5% CO<sub>2</sub> atmosphere. Two days prior to assay, cells were

released from T-175 tissue culture flasks using cell dissociation solution (1X; non-enzymatic [Sigma #C-5914]) and seeded into 96-well, flatbottom tissue culture plates at a density of 15,000 to 20,000 cells per well. After approximately 48 hours, the cell monolayers were rinsed with Hank's balanced salt solution (HBSS) then preincubated with approximately 150 µl/well of assay buffer (HBSS supplemented with 4 mM MgCl<sub>2</sub>, 10 mM HEPES, 0.2% BSA [HH]) containing 1 mM 3-isobutyl-1-methylxanthine ([IBMX] Sigma #I-5879) with or without the antagonist compound of interest at 37°C. After 20 minutes the 1 mM IBMX-HH 10 assay buffer (± antagonist compound) was removed and replaced with assay buffer containing 1.5 µM (CHO cells) or 5 µM (HEK-293 cells) forskolin (Sigma #F-6886) and various concentrations of NPY in the presence or absence of one concentration of the antagonist compound of interest. At the end of 10 minutes, the media were removed and the 15 cell monolayers treated with 75 µl ethanol. The tissue culture plates were agitated on a platform shaker for 15 minutes, after which the plates were transferred to a warm water bath in order to evaporate the ethanol. Upon bringing all wells to dryness, the cell residues were resolubilized with 250 μl FlashPlate® assay buffer. The amount of cAMP in each well was quantified using the [125]-cAMP FlashPlate® kit (NEN #SMP-001) 20 and according to the protocol provided by the manufacturer. Data were expressed as either pmol cAMP/ml or as percent of control. All data points were determined in triplicate and EC50's (nM) were calculated using a nonlinear (sigmoidal) regression equation (GraphPad Prism<sup>TM</sup>). 25 The K<sub>B</sub> of the antagonist compound was estimated using the following formula:

$$K_B = [B] / (1 - {[A'] / [A]})$$

where [A] is the EC $_{50}$  of the agonist (NPY) in the absence of antagonist, [A'] is the EC $_{50}$  of the agonist (NPY) in the presence of antagonist, and

[B] is the concentration of the antagonist.

Non-specific binding was determined in the presence of 1 uM NPY. The reaction mixtures were incubated for 90 minutes at 30° C (NPY1 receptor) or at room temperature (NPY2, NPY4 and NPY5 receptors), then filtered through Millipore MAFC glass fiber filter plates which had been pre-soaked in 0.5% polyethyleneimine. The filters were washed with phosphate-buffered saline, and radioactivity was measured in a Packard TopCount scintillation counter.

For the compounds of this invention, a range of neuropeptide Y5 receptor binding activity from about 0.1 to about 1000nM was observed. For preparing pharmaceutical compositions from the compounds of formula I, pharmaceutically acceptable, inert carriers are admixed with the active compounds. The pharmaceutically acceptable carriers may be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets and suppositories. A solid carrier can be one or more substances which may also act as dilutents, flavoring agents, solubilizers, lubricants, suspending agents, binders or tablet disintegrating agents; it may also be an encapsulating material.

Liquid form preparations include solutions, suspensions and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for either oral or parentertal administration. Such liquid forms include solutions, suspensions and emulsions. These particular solid form preparations are most conveniently provided in unit dose form and as such are used to provide a single liquid dosage unit.

The invention also contemplates alternative delivery systems including, but not necessarily limited to, transdermal delivery. The transdermal compositions can take the form of creams, lotions and/or emulsions and can be included in a transdermal patch of the matrix or reservoir type as are conventional in the art for this purpose.

Preferably, the pharmaceutical preparation is in unit dosage form. In such form, the preparation is subdivided into unit doses containing appropriate quantities of the active component. The unit dosage form can be a packaged preparation, the package containing discrete quantities of preparation such as packeted tablets, capsules and powders in vials or ampules. The unit dosage form can also be a capsule, cachet or tablet itself, or it may be the appropriate number of any of these in a packaged form.

The quantity of active compound in a unit dose preparation may be varied or adjusted from about 0.5 mg to 500 mg, preferably about 0.5 to 100 mg, according to the particular application and the potency of the active ingredient and the intended treatment. The composition may, if desired, also contain other therapeutic agents.

The daily dosage is about 0.01 to about 20 mg/kg. The dosage may be varied depending on the requirement of the patient, the severity of the condition being treated and the particular compound being employed. Determination of the proper dosage for a particular situation is within the skill of those in the medical art. For convenience, the total daily dosage may be divided and administered in portions throughout the day or by means providing continuous delivery.

The invention disclosed herein is exemplified by the following examples which should not be construed to limit the scope of the disclosure. Alternative mechanistic pathways and analogous structures may be apparent to those skilled in the art.

In the examples, the following abbreviations are used: phenyl (Ph), acetyl (Ac), ether (Et<sub>2</sub>O), ethyl acetate (EtOAc), dimethylformamide (DMF) and ethanol (EtOH). Room temperature is RT.
